PCD routerbit has triple flute design

A PCD (Polycrystalline Diamond) routerbit developed by **Lach Diamond, Inc.**, has a triple fluted design which produces increased stability.

The triple flute design equally distributes the chipload, allowing it to work on a larger area with a minimum of vibrations.

The cutting edge geometry of the routerbit, specially designed for CNC routers, now allows the machining of softwoods, plastics and compounds with reinforcements and fillers.

Due to its increased stability the routerbit can also be used in hand-operated routers.

Circle No. 165 on product card.
