## »Dia-2200-mini« - the super simple sharpening machine for the service of all diamond tools for the wood and composite industry

LACH DIAMANT now presents the »Dia-2200-mini« with an axis angle greater than 45° for servicing and manufacturing diamond tools.

A decisive factor for the development of this programme was the tremendous increase in the variety of different materials during recent years.

One example: Fibre composites are currently booming – glass fibres (GRP) in the recreational industry, carbon fibre reinforced plastics (CFRP) in aircraft manufacturing or agricultural machine industry and now also basalt fabrics in the automobile industry. In

the furniture industry the “zero joint” should be mentioned.

The universal grinding machine »Dia-2200-mini« is equipped for these challenges during new production and service for tools with this programme for extreme axis angles. During the subsequent use of the tools, impeccable milling results and flawless surfaces can be expected, e.g. for composite work pieces, without any reworking being required.

**As of now: saw blades up to ø 530 mm  
It has never been easier to sharpen a saw blade**

For the service of all diamond tools for the processing of wood and plastic materials, however, the new »Dia-2200-mini« offers even more: Astonishing is its versatility which is hidden behind the compact mini chassis.

Service and manufacturing of all PCD diamond tools – milling cutters – scoring saws – hogging heads – saw blades up to ø 530 mm – also with multiple fixing – fast and efficient due to the ingenious programmes of the pioneer LACH DIAMANT.
